**How We Apply Game Theory**

**The Koreas**

**CASE STUDY: MARKET EVENT OVERVIEW**
- Korea has been in the media headlines recently, given the threats issued by North Korea’s young leader Kim Jong-Un.
- From a fundamental valuation perspective, Korea is currently one of the more attractive emerging markets equity markets.

**GAME THEORY ANALYSIS HIGHLIGHTS**
- South Korea’s strong coalition power (U.S.) and endowment power (greater nuclear arsenal) provides a decided advantage in the bargaining game.
- The wild card remains whether North Korea’s young leader Kim Jong-Un will make a mistake that leads to escalation.
- At this point in the bargaining process, the strong upper hand of South Korea points to market behavior that is supportive of the attractive valuation.

---

**WHAT IS GAME THEORY?**

- Events, geopolitics, and policy changes affect market prices in ways that can seem uncertain or random.
- William Blair’s Dynamic Allocation Strategies team uses game theory in its analysis to provide clarity on investment opportunities.
- Game theory considers the interests and incentives of the “players”—in this case, governmental and economic leaders.
- Today’s leaders are engaged in a multilateral bargaining game where players devise a strategy and demonstrate various powers as they interact with other players to achieve a desired outcome.
- In order for us to assess investment opportunities and risks, we examine four strategic powers.

<table>
<thead>
<tr>
<th>Strategic Powers</th>
<th>Examples</th>
<th>Demonstrated Behaviors</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endowment</td>
<td>Political capital, nuclear warheads</td>
<td>Confidence, aggression</td>
</tr>
<tr>
<td>Threat</td>
<td>Lob some bombs, sacrifice collateral</td>
<td>Bluffs, aggression, sacrifice</td>
</tr>
<tr>
<td>Risk tolerance</td>
<td>Willing to accept “no agreement”</td>
<td>Bluffs, disinterest, 11th hour</td>
</tr>
<tr>
<td>Coalition</td>
<td>“Merkozy” (Merkel &amp; Sarkozy), media</td>
<td>Solidarity, adaptability</td>
</tr>
</tbody>
</table>

**Our Investment Process**

1. **Identify Value to Price Discrepancies**
   - **Step 1:** Identify Value to Price Discrepancies
   - **Fundamental analysis** identifies where value/price discrepancies exist.

2. **Understand Macro Themes**
   - **Step 2:** Understand Macro Themes
   - **Game theory** helps explain why prices deviate from values.

3. **Integrate Risk Exposures**
   - **Step 3:** Design Portfolio and Integrate Risk Exposures
   - Dynamic risk capital allocations help determine how best to capture investment opportunities.
“We strongly believe that broad macro themes increasingly will dominate portfolio performance. Robust investment processes will need to include a greater focus on integrating the disciplines of game theory, macroeconomic theory, and geopolitical science—the tools required to fathom the behaviors of these players and understand the ramifications of their decisions.”

-Brian D. Singer, CFA

WHY MACRO MATTERS

- Historically, over 90% of portfolio return variation has been attributable to top-down allocation decisions\(^1\)
- Global interconnectedness has increased the relevance and pace at which macro political and economic factors affect investment results
- Traditional asset allocation/portfolio rebalancing may not be dynamic enough to fully reflect opportunities and risks as they unfold

STRATEGY IMPLICATIONS

- Given both valuation and market behavior considerations, we increased our exposure to Korea equity and reduced exposure to frontier markets equity, leaving total equity exposure unchanged
- Re-affirmed won (Korea’s currency) long exposure
- Reduced broader Japanese equity (NIKKEI) long exposure

RISK DISCLOSURES

This material is provided for general informational purposes only and is not intended as investment advice. Any discussion of particular topics is not meant to be comprehensive and may be subject to change. Any investment or strategy mentioned herein may not be suitable for every investor. Information has been taken from sources we believe to be reliable, but its accuracy, completeness or interpretation cannot be guaranteed. Information and opinions expressed are those of the Dynamic Allocation Strategies Team and may not reflect the opinions of other investment teams within William Blair & Company, L.L.C.’s Investment Management division. Information is current as of the date appearing in this material only and subject to change without notice.

Alternative investments strategies, including strategies using options, futures, hedge funds and leverage, are speculative and typically involve a high degree of risk. These investments are intended for experienced and sophisticated investors who are willing to bear the loss of their entire investment and may not be suitable for all investors. Performance of these products may be volatile, and while they may provide the potential for positive returns in both rising and declining markets, the potential for loss is equal. Some alternative investments can be highly illiquid, may not be required to provide periodic pricing or valuation to investors, and may involve complex tax structures and delays in distribution of important tax information. Certain alternatives are not subject to the same regulatory requirements, charge higher fees and may have limited opportunity for early redemption or transference of interests. Alternative investment strategies are not intended as a complete investment program. Each investor should consult their own advisors regarding the legal, tax, and financial suitability of alternative investments.
