

William Blair Emerging Markets Small Cap Growth Fund Fund Manager Commentary

Market Review

Global equities continued to advance in the second quarter (the MSCI ACWI IMI gained +7.18% in the second quarter and 12.68% year-to-date in USD terms) amid further success of vaccination rollouts and a healthy rebound in economic activity, especially in developed markets. The sharp style rotation in the first quarter which favored value areas subsided in the second quarter with growth stocks outperforming. From a global sector perspective, Information Technology outperformed (+10.22% for the quarter and +12.39% year-to-date) while Utilities significantly underperformed (-0.09% for the quarter and +0.86% year-to-date). Energy also continued to rally (+10.08% for the quarter and +30.51% year-to-date) as rising demand drove stronger crude oil prices.

US equities advanced (+8.36% for the quarter and +15.05% year-to-date) as investors welcomed news of additional federal spending to revive the economy. In addition to the \$1.9 trillion Covid relief plan and \$2.3 trillion infrastructure plan introduced in the first quarter, the Biden administration also announced a \$1.8 trillion American Families Plan emphasizing strong support for national childcare to ensure an equitable recovery from the pandemic, especially for female workers and mothers. Significant federal spending drove concerns over rising inflation. In May, headline inflation rose to 5.0% year on year, above expectations.

European equities kept pace with the benchmark (+7.26% for the quarter and +11.81% year-to-date) as several European countries gradually relaxed restrictions on travel and business activity. Economic data was also supportive, specifically the Eurozone manufacturing purchasing manager's index (PMI) which rose to a record high level (63.4) in June.

Strength within Latin America (+15.56% for the quarter and +9.64% year-to-date) was primarily driven by Brazil (+23.60% for the quarter and +11.89% year-to-date) bolstered by stronger commodity prices and currency tailwinds. China underperformed on a relative basis (+2.35% for the quarter and +2.36% year-to-date) amid concerns over tightening liquidity and increased regulatory oversight on large cap technology companies.

Fund Performance

During the quarter the William Blair Emerging Markets Small Cap Growth Fund (Class N shares) underperformed its benchmark, the MSCI Emerging Markets Small Cap Index (net). Negative stock selection within the Industrials and Financials sectors detracted from results during the period. Within Industrials, the lack of exposure to shipping companies hampered relative results as marine transportation companies rallied 136% during the quarter amid the faster-than-expected global recovery and stronger freight rates. Zhejiang Dingli

Top 10 Holdings¹ as of 6/30/2021

AU Small Finance Bank Limited	1.8
Astral Ltd.	1.7
TCS Group Holding PLC	1.7
Jiumaojiu International Holdings Ltd.	1.7
momo.com Inc.	1.7
Total Top 10	19.5

Machinery Co Ltd also detracted to relative performance as the stock fell on disappointing operating performance with increasing competition and an unfavorable product mix hurting margins. We exited the position as a result. AU Small Finance Bank Ltd is an Indian bank specializing in small ticket retail loans on income generating products targeting the unserved and underserved customer segments within the Financials sector. The stock price weakened during the quarter amid soaring COVID-19 cases in India driving weaker investor sentiment and asset quality.

Strong stock selection within the Consumer Discretionary and Information Technology sectors offset these results. Within Consumer Discretionary, Momo.com Inc and F&F Holdings Co Ltd. boosted relative performance. Momo.com, the leader in e-commerce in Taiwan, rallied as the increased COVID-19 outbreak in Taiwan drove higher online sales and helped boost broader adoption. F&F is leading manufacturer of apparel and accessories under licensed brands such as Discovery and MLB, primarily in Korea and China. The company adopted a new holding structure and the new F&F subsidiary rallied following its listing amid rapid growth in China, propelled by the MLB brand coupled with the company's strong distribution capabilities. Totvs, the Brazilian ERP software company, bolstered results within the Information Technology sector. The

share price strengthened as the company reported all-time high revenues on the backdrop of accelerated demand and continued to execute well on its growth strategy.

Positioning

During the second quarter, Consumer Discretionary exposure was increased through the purchases of Makalot Industrial Co Ltd and Ozon Holdings PLC.

Makalot is one of the leading garment makers in Taiwan and is highly leveraged to the US consumer which is experiencing a sharp recovery. We believe the company will deliver mid-teens sales and earnings growth over the next several years, driven by new product introductions, mix improvement, new client wins, and share gains at existing clients.

Ozon is a Russian ecommerce platform and a recent IPO. Russian e-commerce is at a very early stage and therefore very underpenetrated (currently 9% of retail sales). The new management team is executing on a compelling strategy aiming to take a leading position in the market, leveraging its brand, data, network effects, and cost advantage of a multi-sided marketplace. Returns are currently negative as Ozon is investing heavily in its platform to drive growth; however, we expect operating leverage and low incremental costs to drive CFROIC to the high teens in the next ten years.

Materials exposure was also increased to an overweight position during the period. Skshu Paint, a leading domestic supplier of coatings in China, and Vinati Organics, the India-based manufacturer of specialty chemicals and organic ingredients, were purchased during the period.

Skshu Paint has a strong brand image underpinned by the quality of its products which are environmentally friendly and comparable to high quality foreign brands. We believe the company is well positioned to benefit from increased consumer demand for higher quality, increasing safety and environmental standards, and import substitution while higher raw material prices, financing conditions, and other market dynamics should drive market consolidation and share gains.

Vinati Organics is among others the largest manufacturer in the world for IBB, the primary raw material for Ibuprofen production, and for ATBS, a key component that make acrylic fibers receptive to dye. We believe revenue will grow at a ~36% CAGR over the next three years driven primarily by a strong increase in ATBS demand and steady IBB sales as the company takes advantage of the large import substitution opportunity, and new product launches.

These increases were offset primarily by reductions to Industrials and Information Technology. Within Industrials, Escorts Ltd, Zhejiang Dingli Machinery and Randon Implementos were sold during the period. Escorts was eliminated in April amid its weakening growth outlook. The Zhejiang Dingli sell was driven by the company's deteriorated competitive positioning and increased margin pressure, while the Randon liquidation was predicated on slower revenue growth outlook and higher raw materials prices weighing on margins.

Silergy Corp within the Information Technology sector was liquidated during the period due to market cap considerations. From a geographic perspective, notable adjustments were an increase to Russia, offset by decreases to Taiwan and Thailand.

Outlook

The market is experiencing a tug of war between the impressive acceleration of economic growth due to global re-openings, and fears of a resurgence of COVID virus case counts. We believe economic growth will win out. While concerning, the positive view is that the vaccines are working, and the delta variant is proving not as harmful.

As for recent economic activity, it has been more of the same, with both consumption and production activity strong – in some cases above 2019 levels. While we expect a sequential peak in GDP growth likely occurred in 2Q, the remainder of the year should continue to be quite strong.

We believe that corporate earnings growth, which has been impressive thus far in 2021, remains underestimated. In fact, projected bottom-up corporate profit growth lags top-down GDP estimates by a wider margin than we saw coming out of the global financial crisis of 2008 (GFC). Thus, we are confident profit growth will continue to surprise to the upside.

As is the case in almost every economic expansion period, earnings growth has been the key market driver. We are now clearly in expansion mode, with the corporate profit picture and market leadership following the script.

During the second quarter, we saw earnings revisions and momentum lead market performance, while valuation flipped from dominating in 1Q (typical of recovery periods) to not much of a factor. Quality and Growth re-asserted themselves positively. All of these characteristics are very typical of performance during an economic expansion, and we believe they are likely to continue.

Inflation concerns have been a natural topic of debate all year. We continue to foresee reflation back to long-term, i.e., manageable, levels. In this unique cycle, we are experiencing price increases driven by the re-opening of supply not keeping up with demand fast enough. While in some cases we are already seeing a few industrial commodity prices reverting, we expect that it will take another 3-6 months for the supply catch up to occur across most industries.

The global market is up close to 40% over the last twelve months. While market valuations receive a lot of attention, perhaps unnoticed is that this market appreciation has been driven entirely by earnings growth. The market has actually derated a bit during this period.

More economically sensitive sectors of the market (e.g., cyclicals and financials) have re-rated along with a resurgence of their growth. In contrast, companies with stronger structural long-term growth have lagged on a relative basis, and in some cases have seen their stock multiples compress. We view this is a classic period of structural winners "growing into" their multiples.

Consistent with our growth outlook we believe most of this experience is likely behind us but may occur off and on during the balance of the year while the market digests the economic and profit picture. Ultimately as economic growth reverts to the long-term mean and the market begins to discount peak cyclical earnings, the structural growers will again have their day.

Corporate Capital Expenditures

Corporate profit margins and cash flows have been impressive, and we believe we are entering an era where more of that cash flow is likely to be directed to capital investment and research and development.

We see two reasons for rapidly ramping capital spending by corporates: 1) digitalization of businesses is now a survival imperative; and 2) shortening supply chains has become necessary to improve operational resilience.

We are witnessing it already: After the GFC, it took US private sector non-residential investment nearly four years to recover to pre-crisis levels. By contrast, capex spending in Q1 2021 already surpassed the Q4 2019 peak. Intellectual property and software investment recovered by Q4 2020, compared to six quarters post-GFC.

The COVID pandemic has elevated operational efficiencies of digital business models into a survival imperative for virtually all companies. Digital businesses were able to operate relatively unscathed during the pandemic lockdowns, while more traditional, high physical contact businesses were forced to shut down. Within industries, those companies who had proactively employed more data and digitally-enabled business practices pressed their competitive advantage. We are seeing companies of all sizes accelerate their investment into cloud-based systems, remote work, digitally driven customer service solutions, and the requisite software applications required to make it all work.

Companies have spent decades rationalizing their supply chains with the goal of maximum operational efficiency. Such extreme efficiency comes with high potential fragility. And this fragility was fully exposed by COVID-related lockdowns and associated export restrictions. Companies are looking to shore up their supply chains, in some instances by reducing or duplicating some parts of the chain. Some of this was starting to happen in response to chilling economic relations between the U.S. and China prior to the pandemic. COVID has only added more reasons to accelerate the buildout.

Shifts in the geopolitical environment in which corporates operate also support investment rather than cash preservation. Since the early 1980s everything from taxation to antitrust to regulatory and labor policies was geared to improving corporate profitability. Today, there is growing recognition that these policies may have gone too far. The operating environment is changing on the margin: pressure for stronger wage growth, especially at the bottom of the income distribution is rising.

The G7 agreeing on a minimum corporate tax rate suggests that the race to the bottom is over. Antitrust authorities in China, Europe and the US are openly exploring ways to bring competition standards to industries and businesses that have

been able to behave as monopolies or quasi monopolies. These changes incentivize corporate investment, which in turn will likely expand supply and enable stronger economic growth without higher inflation. We will have more to say on this topic in the coming months and quarters.

Spotlight: Industrials

The confluence of the strong economic cycle and what we expect will be a step up in capital investment spending suggests a portfolio focus on industrials. In fact, many of our portfolios, especially those that include developed markets, have had significant overweight exposure to industrial industries for the last several years.

The key attribute for any of our company investments is a strong and durable competitive advantage, and industrials have several advantages in this regard, even compared to the technology and consumer sectors, which may seem counter intuitive.

Many industrial applications are characterized by hard-to-develop products that require domain knowledge, scale, and manufacturing expertise. Route-to-market, capital allocation, and installed bases are other often powerful and durable advantages.

High entry barriers and consolidated markets are also powerful attributes. Industry structure is important as it influences how industrial value creation is distributed and the risk of value destruction. Favorable market structures exist in areas as diverse as North American rails, aircraft production, airlines, HVAC manufacturing, and other niche markets.

Long duration growth

Although industrial company growth rates may be more modest compared to the fast-moving technology sector, growth is often more durable and exploitable over long periods of time. This persistence of growth is what investors tend to underestimate, and where the market is less efficient.

Industrial processes are often complex and have been optimized over many years. Combined with a high risk of failure, this results in strong inertia and risk aversion that slows adoption of new technologies. In contrast, consumer technology is fast moving as consumers adopt new technologies rapidly in their daily lives. While growth rates are slower for industrial companies, predictability and durability of growth allows companies to exploit opportunities for years if not decades.

Once a company has built an installed base it typically provides an attractive aftermarket opportunity that results from demanding operating conditions, safety, and quality considerations. Jet engines are a classic example where the installed base often provides decades of lucrative services and parts revenue for manufacturers. Strong competitive advantages, high switching costs, and customer risk aversion allow for pricing power in many cases.

The increasing focus on environmental and social considerations has strengthened the role of efficiency in the customer value proposition. For many industrial companies, energy efficiency and safety have been cornerstones of their value proposition from the beginning. These companies enable

the reduction of emissions and waste through new, more efficient products and engineering-driven solutions. For example, Spirax-Sarco recently implemented solutions at a Nestle factory that reduced energy use by 45%, emissions by 43%, and water use by 48%.

Potential for strong cash generation and value creating capital allocation

Industrial companies often generate strong cash flow that can be used to fund value-creating organic and inorganic growth.

Domain knowledge and customer intimacy provides opportunities to develop innovative new products and solutions. These products add value for customers and long competitive advantage periods may allow for the realization of strong returns on capital from the investment to develop these products.

Industrial companies often complement organic growth opportunities with value creating M&A. The rationale for acquisitions may include scale, new technologies, and attractive assets in a multi-industry portfolio of businesses.

The top industrial companies have demonstrated discipline by returning cash to shareholders after exhausting organic and inorganic investment opportunities. For example, Atlas Copco has paid \$9 billion in regular dividends over the past 10 years, and on three occasions has paid special dividends worth a cumulative \$3.3 billion.

Strategic use of financial leverage

Long lived assets and strong competitive advantages allows for the comfortable use of modest leverage to boost returns. Re-leveraging with debt to maintain a constant capital structure is often used to enhance cash flows and returns to equity holders. The strength of business models and competitive advantages can also provide firepower to flex debt levels higher to seek to capitalize on inorganic opportunities. For example, DSV has used leverage to make highly accretive acquisitions the past several years.

Stock specific drivers

Many industrial companies are cyclical and can be volatile stocks. While we are long term investors, we believe that the market tends to overreact to the economic cycles influencing the best-managed industrial companies. This creates opportunities for active managers to deploy capital into mispriced value creators and protect value when the market is too enthusiastic near term.

INVESTMENT PERFORMANCE (AS OF 6/30/21)

	QTR	YTD	1 Y	3 Y	5 Y	Since Incep.
Class I (SI: 10/24/11)	10.93%	13.71%	49.10%	15.43%	13.00%	12.25%

IMPORTANT DISCLOSURES

The Fund involves a high level of risk and may not be appropriate for everyone. You should only consider it for the aggressive portion of your portfolio. The Fund's returns will vary, and you could lose money by investing in the Fund. The Fund holds equities which may decline in value due to both real and perceived general market, economic, and industry conditions. Investing in securities of smaller companies tends to be more volatile and less liquid than securities of larger companies. International investing involves special risk considerations, including currency fluctuations, higher volatility, lower liquidity, economic and political risk. Investing in emerging markets can increase these risks. The securities of emerging market companies may be subject to greater volatility and less liquidity than companies in more developed markets. Individual securities may not perform as expected or a strategy used by the Adviser may fail to produce its intended result. Currency rates may fluctuate significantly over short periods of time and may reduce the returns of a portfolio. Convertible securities may be called before intended, which may have an adverse effect on investment objectives.

The Morgan Stanley Capital International (MSCI) Emerging Markets Small Cap Index (net) is a free float-adjusted market capitalization index that is designed to measure equity market performance of small cap companies in emerging markets. This series approximates the minimum possible dividend reinvestment. The Index is unmanaged, does not incur fees or expenses, and cannot be invested in directly.

This content is for informational and educational purposes only and not intended as investment advice or a recommendation to buy or sell any security. Investment advice and recommendations can be provided only after careful consideration of an investor's objectives, guidelines, and restrictions.

Please carefully consider the Fund's investment objectives, risks, charges, and expenses before investing. This and other information is contained in the Fund's prospectus and summary prospectus, which you may obtain by calling +1 800 742 7272. Read the prospectus and summary prospectus carefully before investing. Investing includes the risk of loss.
