

William Blair Emerging Markets Leaders Fund Fund Manager Commentary

Market Review

Global equities declined (-1.11%) in the third quarter as volatility picked up in September, erasing gains in July and August. Developed Markets were flat (-0.19%) but outperformed Emerging Markets (-7.39%) primarily due to weakness within China. From a global sector perspective, Consumer Discretionary (-5.13%) and Materials (-4.45%) lagged. Conversely, Energy continued to outperform (+2.87% for the quarter and +34.26% year-to-date) as rising demand and supply constraints drove stronger crude oil prices.

US equities were flat (-0.06%) for the quarter as economic data remained healthy, albeit past the peak rate of growth, and solid corporate earnings helped offset volatility induced by the rise of new Delta variant cases. At the much-anticipated Jackson Hole symposium, Federal Reserve Chairman Jerome Powell noted that the economy has made “substantial further progress” on inflation, while the labor market has also made “clear progress”. The Fed also announced that the tapering of quantitative easing could start this year and finish in mid-2022.

Japanese equities were flat in July and August but advanced strongly in September to close out a solid third quarter (+4.35%). Strength within Japan was primarily due to the announcement that Prime Minister Suga would not be running for re-election in November. Despite a very short time in office (less than a year), Suga’s approval ratings were very low following the administration’s handling of the coronavirus pandemic.

Emerging Markets sharply declined (-7.39%) primarily due to weakness within China (-17.99%). In late July, the Chinese government announced new regulatory moves which negatively impacted companies in the technology and private education sectors. Hampered investor sentiment was further compounded in late September on concerns over the collapse of Evergrande, one of China’s largest real estate developers, and the potential impact on China’s financial system. Conversely, India continued to advance (+12.64%) amid a slowdown in the country’s new COVID-19 cases and a significant liquidity boost from the country’s central bank and foreign inflows.

Fund Performance

Outperformance by the William Blair Emerging Markets Leaders Fund (Class N shares) versus the MSCI Emerging Markets (net) was primarily driven by positive stock selection across most sectors. Stock selection within the Information Technology and Industrials sectors was particularly strong. Within Information Technology, Globant SA and eMemory Technology Inc. helped relative returns. Globant is the Argentinean IT service company focused on revenue generating activities, enriched end-user experiences and servicing primarily US customers. The company’s growth continued to accelerate to record highs driven by all

Top 10 Holdings¹ as of 9/30/2021

MediaTek Inc.	2.4
Total Top 10	38.8

geographies, most notably, new Europe expansion which grew +245% YoY. The company’s growth outlook remains robust due to strong demand for digitization and its exposure to service industries recovering from COVID’s impact. eMemory Technology Inc. is a Taiwanese semiconductor IP company. The company’s revenue growth was boosted by a favorable wafer pricing dynamic. New product launches and wider adoption of their solutions at leading edge technologies further support a robust medium-term growth outlook. Grupo Aeroportuario Del Pacifico, the Mexican operator of Los Cabos and Tijuana airports, bolstered returns in the Industrials sector as it benefited from air traffic recovery and opening of new international routes.

Partially offsetting these effects were an overweight allocation to the Communication Services sector and an overweight allocation to China, coupled with below average stock selection within the Financials and Consumer Staples sectors. Within Financials, Ping An Insurance Group and B3 SA - Brasil Bolsa Balcao weighed on relative returns. Ping An’s share price weakened amid China property concerns, regulatory tightening, and continued weakness in its life business. B3’s stock performance declined due to investor concerns about heightened legal contingency risks and increased competition,

coupled with lower volume and unfavorable mix due to higher Selic. Within Consumer Staples, Lg Household & Health Care Ltd weighed on relative performance as the company delivered weaker-than-expected second quarter results and a cautious second half of the year outlook due to continued margin pressure from increased promotional costs in China.

Positioning

During the period, Communication Services exposure was reduced through the liquidation of Tencent Music Entertainment, the online music entertainment platform in China. This liquidation was driven by regulatory headwinds due to government's restrictions on exclusive content coupled with risk of anti-monopoly actions against Tencent as well as intensified competition in the social business and ADR delisting risk. Consumer Discretionary exposure was also reduced during the period. TAL Education is a leading tutoring services provider in China with a strong brand and significant growth opportunities. We decided to exit the position despite the significant price decline as the government actions against After School Tutoring (AST) companies exceeded our worst-case-scenario expectations, posing existential risk for the company both due to the transition into not-for-profit status and a threat to the public listing status.

These reductions were offset primarily by increases to Information Technology and Industrials. Locaweb Servicos de Internet within the Information Technology sector was purchased during the period. Locaweb is a Brazilian internet company that provides diverse digital solutions for SME businesses. Our thesis is based on the company's ability to deliver rapid growth, coupled with high and rising profitability and top decile returns. The nature of the company's open platform that offers 350+ integrations, a more localized and cost-effective offering versus global competitors is, in our view, a key competitive advantage driving growth and returns. Havells India, a leading electrical goods company in India, was purchased within Industrials. We believe its leading market share, prestigious brand and strong distribution will allow the company to continue to outgrow the market, benefiting from increasing penetration and premiumization.

From a geographic perspective, notable adjustment was increases to India, offset by decreases to China.

Outlook

Corporate performance has been strong as the global economies continue to resume normalized activity. We have seen strength in the cyclical areas of the economy, while at the same time companies with leading business models and practices have continued to press their structural competitive advantage. This has driven positive momentum for the market this year, and companies with strong returns and differentiated positioning like those we seek to invest in have generally enjoyed even stronger corporate and stock market performance on balance. While we do not expect the backdrop to change materially, we do point out two primary areas of intermediate-term focus for global equity investors: China policy and regulation risk, and the inflation outlook.

China

We view the China investment opportunities and risks within the framework of what has, and what hasn't changed. In turn we reference our investability model to determine exploitability and accessibility for returns in Chinese equities.

Favorable elements of what hasn't changed include China's commitment to economic growth, accelerated corporate innovation across many industries, and liberalization of capital markets to compete on a global stage. At the same time, the nature of the autocratic regime and state-planned economy has facilitated the execution of the China Communist Party's (CCP) objectives through policies and regulations directing resources into innovative sectors and facilitating the emergence of new industries and global champions.

The absolute power of the state to enact and enforce policy and regulation is another constant characteristic of China. The current regulatory crackdown on industries that have benefited from policy support (or at least the government's laissez-faire approach), while seemingly unexpected, is, when analyzed closely, consistent with the government's priorities and past attitudes and actions toward other industries.

Chinese leadership's reprioritization of its objectives to rebalance growth versus social issues is one example. Given China's current stage of development, its focus is on Common Prosperity and more balanced growth as opposed to its prior target of fast growth.

Under the surface, China's economic achievements have seemingly caused growing tensions between the country's socialist political and ideological goals and growing capitalist (profit-led) economy.

Increased inequality, changes in demographics, and the emergence of new sectors and dominant private corporations have become a significant part of the economy, posing new and critical challenges to the Chinese authorities.

In particular, the digital economy industries and companies have reaped the benefits of an extremely supportive regulatory backdrop, favorable taxation, and access to foreign capital. While many of these companies have benefited society at large by providing availability of goods, cheaper prices, life-enhancing digital services (ecommerce, payments, access to capital, etc.), Chinese leadership is now concerned about the potentially negative impact on inequality and social values that some of these industries have had. It also appears Chinese leadership is concerned about the threat that has arisen from the amount of power accumulated by some platform companies, the influence that foreign investors exert on them, and the potential systemic risks that exist with these new data-heavy business models.

With this, the Chinese authorities have indicated their intention to address perceived excesses and shortcomings that have arisen from the previous policy period, while doubling the size of China's economy by 2035. Beijing's priorities are focused on three core issues: social stability, national security, and sustainable domestic growth.

The fact that these objectives may at first sight seem difficult to reconcile, coupled with the ample room for interpretation of the government's intentions and apparent lack of rules (given the

principle-based nature of Chinese regulations), has created much angst and many hurdles for companies as they operate their businesses.

The drastic enforcement of this new wave of regulations in the new economy is, as expected, painful, messy, and a source of angst for companies and investors alike. It has led to irreparable damage and loss in certain industries, such as after-school tutoring (AST). The lack of coordination among different regulators and institutions, conflicting priorities, battles for power, and personal attitudes (a la Jack Ma) have driven regulatory scrutiny in fits and starts, sending ambiguous messages to investors. We believe this is likely to continue.

Also playing a role in the regulatory crackdown is a deepening rivalry between the United States and China, in our view. While China's transformative growth trajectory has posed domestic challenges, it has also raised concerns for the rest of the world and particularly the United States. As China became a strategic competitor to the United States, tensions arose on trade and economic issues, then expanded to technological, geopolitical, ideological, and financial fronts. As a result, China's regulatory crackdown has focused on industries with stronger foreign connections, especially those in highly sensitive sectors.

In particular, Beijing's desire to bring home some of its largest and most attractive companies that are listed overseas coincided with increased scrutiny from the United States on Chinese American depository receipts (ADRs). This occurred with the passing of the Holding Foreign Companies Accountable (HFCA) Act, which sets a timeline for the forced delisting of these companies. This has called into question the legality and enforcement of the important variable interest entity (VIE) structure, as well foreign governments' willingness to allow investment in Chinese companies.

Where from here?

One thing is clear: Not all industries and companies are equal on these fronts, and a thorough evaluation of their alignment with Beijing's key objectives and priorities should help determine the extent of the impact and viability of entire industries.

For foreign investors, the new paradigm also calls into question the investability of China. To assess this, we have a framework that seeks to identify the exploitability and accessibility of future corporate growth and returns.

"Exploitability" moves beyond the typical definition of a company's ability to innovate, create products and services, and grow profitably; in this case it also assesses the degree of alignment between the corporation's activities and the government's objectives. Here, we assess the potential outcome and variability in a conventional financial model. Industries that we believe may have elevated risk include media, online retailing, education, gaming, and healthcare, specifically pharmaceuticals. We are actively researching the variability and distribution of future outcomes of revenues and profits for our portfolio holdings in these industries and adjusting our estimates accordingly.

"Accessibility" refers to foreign investors' ability to access economic value creation. Here, we assess the Chinese government's intention of allowing foreign capital into certain

industries, including threats to the VIE structure as well as the risk to ADR listings.

Assuming foreign investors are not banned, but the degree of accessibility is in question, we discount the potential future earnings in the form of an increased equity risk premium (ERP), and ultimately weighted average cost of capital (WACC) or discount rate.

We believe the market may have become too sanguine regarding China's country risk, with the ERP as low as that of many developed markets late last year. With the recent market correction, it has risen back to its long-term average.

The assumption that the Chinese government intends to ban foreign capital is radically opposed to the consistent efforts from Beijing to open its capital markets, giving access to foreign investors and developing the internationalization of the renminbi. Still, selective strategic industries may be affected by bans amid increased protectionism in the name of higher public interest. This was the case with the AST (after school tutoring) industry.

Needless to say, while we continue to find China's long-term growth and corporate performance opportunities attractive, our investability framework has identified greater uncertainty and thus risk. In many of our investment strategies, we have cut our China weightings materially, by many cases in half from prior high levels. We feel this is the prudent response to many of the industries and companies that may remain at risk of being in the crosshairs of more government regulatory scrutiny. At the same time we have rotated our Chinese investments into those companies whose growth opportunities are aligned with government objectives.

We do recognize that the real and perceived interpretation of these risks could change, in particular with more transparency of intention from the government. We have spent a great deal of collective research time on these important issues, and that will likely be the case well into and beyond 2022.

Inflation

As our economies gradually reopen and people are allowed to move more freely, the 2020 experience should reverse. We believe the challenges with goods production and longer delivery times will get resolved within months, not years, and goods price inflation will likely return to the pre-COVID muted annual rate of sub-2%. Services prices will likely move sharply higher as restaurants, theatres, and travel reopen. We may even see pockets of quite large price increases, as supply will not be able to adjust instantly to all the pent-up demand, in leisure travel for example.

These pockets of much stronger price gains generate headlines, but we believe the argument that such isolated, temporary pockets of price pressures will translate into sustained, higher annual inflation in the medium term is weak because it does not consider supply adjustment.

We expect the supply responses to play out in the coming quarters to meet demand levels. First, in our view there is no reason to believe the current logistical bottlenecks will prove to be structural, rather they are recovering from the complexity of a shutdown that we haven't experienced in decades. On the

other hand, the two biggest risks of persistent inflation arise from labor and energy prices. In the US alone, we have seen an employment gap of close to 10 million workers. The vast majority of those workers in our estimation are only temporarily sidelined due to COVID-related issues, ranging from childcare and safety concerns, to paycheck relief benefits outweighing wages. We are already beginning to see the gradual resumption of those workers back into the workforce and expect that to play out through next year.

As for energy prices, we do not believe there is a structural lack of supply owing to the energy transition from fossil fuels to renewables. Instead, we believe much of the move in oil and gas prices is attributable to the geopolitical complications from the Nord Stream 2 pipeline that has yet to come on-line. While complicated, we believe the political incentives are largely aligned, and this will be resolved in the coming months providing important relief to energy prices.

In the medium term, stronger economic growth of around 3% can translate into a sustainable annual inflation rate of 2%-3%. Every policymaker and consumer would be pleased with that outcome. The central banks would welcome this with open

arms instead of worrying about inflation being too low as a result of weak growth. We believe this is the most likely probability for the next several years.

Recently the risk of stagflation has received a great deal of attention. The bottom line is that the calamitous experience of the 1970s had much to do with egregious macroeconomic meddling, and inflation did not appear suddenly out of nowhere. Misguided price controls and wage freezes disincentivized supply adjustment and destroyed demand growth. The 1970s bear no resemblance to what we are talking about today: stronger demand growth, employment, and supply adjustment and more stable, mild inflation consistent with price stability, broadly defined.

Our current outlook calls for growth continuing to slow on a sequential basis, supply chains resuming their historic efficiencies, and peaking corporate profit margins moderating. Coming from historically high valuations, we would expect only modest outcomes for equities over the coming quarters.

INVESTMENT PERFORMANCE (AS OF 9/30/21)

	QTR	YTD	1 Y	3 Y	5 Y	10 Y
Class I (SI: 03/26/08)	-8.63%	-5.12%	10.68%	13.05%	10.76%	7.35%
Class N (SI: 05/03/10)	-8.73%	-5.35%	10.34%	12.72%	10.47%	7.05%
MSCI Emerging Markets Index (net)	-8.09%	-1.25%	18.20%	8.58%	9.23%	6.09%

EXPENSE RATIOS

	Gross Expense	Net Expense
Class I	1.33%	1.15%
Class N	1.63%	1.40%

Expenses shown are as of the most recent prospectus. The Fund's Adviser has contractually agreed to waive fees and/or reimburse expenses to limit fund operating expenses until 4/30/22.

IMPORTANT DISCLOSURES

The Fund involves a high level of risk and may not be appropriate for everyone. You should only consider it for the aggressive portion of your portfolio. The Fund's returns will vary, and you could lose money by investing in the Fund. The Fund holds equities which may decline in value due to both real and perceived general market, economic, and industry conditions. Investing in securities of smaller companies tends to be more volatile and less liquid than securities of larger companies. International investing involves special risk considerations, including currency fluctuations, higher volatility, lower liquidity, economic and political risk. Investing in emerging markets can increase these risks. The securities of emerging market companies may be subject to greater volatility and less liquidity than companies in more developed markets. Individual securities may not perform as expected or a strategy used by the Adviser may fail to produce its intended result. Currency rates may fluctuate significantly over short periods of time and may reduce the returns of a portfolio. Convertible securities may be called before intended, which may have an adverse effect on investment objectives.

The Morgan Stanley Capital International (MSCI) Emerging Markets Index (net) is a free float-adjusted market-capitalization-weighted index that is designed to measure equity market performance of emerging markets. The Index is unmanaged, does not incur fees or expenses, and cannot be invested in directly.

This content is for informational and educational purposes only and not intended as investment advice or a recommendation to buy or sell any security. Investment advice and recommendations can be provided only after careful consideration of an investor's objectives, guidelines, and restrictions.

Please carefully consider the Fund's investment objectives, risks, charges, and expenses before investing. This and other information is contained in the Fund's prospectus and summary prospectus, which you may obtain by calling +1 800 742 7272. Read the prospectus and summary prospectus carefully before investing. Investing includes the risk of loss.
