Past Performance is not a guarantee of future results. A direct investment in an index is not possible.

The Russell 3000 Index measures the performance of the all-cap segment of the U.S. equity universe. The Russell 1000 Index measures the performance of the large-cap segment of the U.S. equity universe. It includes approximately 1000 of the largest securities based on a combination of their market cap and current index membership. The Russell Midcap Index measures the performance of the mid cap segment of the U.S. equity universe. It includes approximately 800 of the smallest securities in the Russell 1000 Index based on a combination of their market cap and current index membership. The Russell 2500 Index measures the performance of the small to mid-cap segment of the U.S. equity universe. It includes approximately 2500 of the smallest securities in the Russell 3000 Index based on a combination of their market cap and current index membership. The Russell 2000 Index measures the performance of the small cap segment of the U.S. equity universe. It includes approximately 2000 of the smallest securities in the Russell 3000 Index based on a combination of their market cap and current index membership. Core returns represent the Total Return indices. The value segments of these indices include companies with lower price-to-book ratios and lower forecasted growth values. The growth segments of these indices include companies with higher price-to-book ratios and higher forecasted growth values.

Market Performance

- In a volatile first quarter, U.S. equity indices declined as the Omicron wave, inflation concerns, and the invasion of Ukraine weighed on equity valuations.
- The Russian invasion of Ukraine intensified inflationary pressures and supply chain concerns, given Russia's role as a major energy and commodity producer
- With higher inflation and an increase in expectations for the pace of Fed rate hikes, equity valuations were pressured while U.S. corporate earnings remained solid.

Style Performance

- During the first quarter, value indices outperformed growth indices across the size spectrum.

Market Cap Performance

- Large caps modestly outperformed small caps across the style spectrum in the first quarter.

Past returns are no guarantee of future results. Based on Global Industry Classification Sectors (GICS). Concentration of assets in one or a few sectors may entail greater risk than a fully diversified stock portfolio and should be considered as only part of a diversified portfolio.

Virtu Financial (VIRT) is a leading electronic market maker and liquidity provider to the global financial marketplace and one of the largest execution-only agency brokers given its 2019 acquisition of ITG. The company reported prior quarter results that exceeded expectations driven by strong execution and revenue synergies. Additionally, shares benefited from higher volatility and trading volumes year-to-date. We trimmed our position on an incrementally less attractive risk/reward profile following outperformance of the stock. We continue to believe the company's scale and asset class diversification create a large barrier to entry and lower risk profile over the long term.

Crown Holdings (CCK) produces beverage, aerosol and food cans, as well as transit packaging consumables and equipment. The company announced solid earnings results and revenue guidance that was ahead of expectations despite facing inflationary pressures. Demand in the industry remains strong and the company continues to expand capacity to service this growing demand. We trimmed our position. We continue to believe the company operates a business with Consumer Staples-like durability in an industry with strong pricing power and an improving growth backdrop given the superior environmental qualities of aluminum cans relative to plastics.

SolarEdge Technologies (SEDG) is the world's largest manufacturer of solar inverters employing Modular Level Power Electronics (MLPE) which allows a solar array to produce the maximum power from each module. During the quarter, the stock benefited from improving affordability of solar solutions, increased demand for carbon offsets and the company's superior technology relative to competition. We continue to believe in the high value proposition of SolarEdge's products, and that continued geographic expansion, scale and technological innovation will drive market share gains in the long term.

Specific securities identified and described do not represent all of the securities purchased, sold, or recommended for advisory clients, and you should not assume that investments in the securities identified and discussed were or will be profitable.

Trex Company (TREX) is the industry leader in composite residential decking. The company has a material cost advantage relative to its competitors, driven by its use of recycled plastic as an input in its composite decking, which has allowed it to introduce lower-priced products that are increasingly attractive relative to wood. Trex reported quarterly results that were largely in line with expectations, but indicated some headwinds were likely for 2022. Specifically, the company indicated higher marketing and branding expenses as well as tougher comparisons in the second half of 2022. Along with other building materials stocks, shares were also pressured by concerns of rising rates. Customer conversion from wood to composite boards continues to accelerate due to its ease of use, length of life and shrinking cost difference, and we continue to believe Trex's lower-priced composite product will allow the company to gain share at a healthy pace. We maintained our position.

Burlington Stores (BURL) is the third largest U.S. off-price retailer. During the quarter, Burlington experienced a slowdown in traffic related to a challenged inventory position, which created near term uncertainty and resulted in 2022 guidance that was weighted to the second half. More recently, inventory availability has improved and, over the longer term, there is no change to our thesis of off-price continuing to gain share given the superior consumer value proposition. Further, we believe Burlington can close the margin gap with off-price peers, driven by improved sales productivity, better inventory control and lower occupancy costs. We maintained our position.

Fox Factory (FOXF) is manufacturer of premium off-road suspension systems for bikes and powered vehicles (e.g., all-terrain vehicles, snowmobiles, motorcycles, etc.). While Fox Factory continues to experience strong demand for its products, the company issued forward looking guidance that was below expectations, largely due to supply chain issues and Omicron-induced production delays. Margins were also pressured due to raw material, production and freight pressures. We anticipate an easing of margin pressures as the company is in a position to take price and as its new manufacturing plant becomes fully operational. We maintained our position. We believe the stock is attractively valued relative to the durability of growth drivers and a rising ROIC profile.

Glossary - Terms

Active Share: A measure of the percentage of equity holdings in a portfolio that differ from the benchmark index. It is calculated by taking the sum of the absolute value of the differences of the weight of each holding in a portfolio versus the weight of each holding in the index and dividing by two.

Alpha: A measure of a portfolio's return in excess of the market return, after both have been adjusted for risk. It is a mathematical estimate of the amount of return expected from a portfolio above and beyond the market return at any point in time. For example, an alpha of 1.25 indicates that a stock is projected to rise 1.25% in price in a year over the return of the market, or the return when the market return is zero. When an investment price is low relative to its alpha, it is undervalued, and considered a good selection.

Beta: A quantitative measure of the volatility of the portfolio relative to the overall market, represented by a comparable benchmark. A beta above 1 is more volatile than the overall market, while a beta below 1 is less volatile, and could be expected to rise and fall more slowly than the market.

Developed Markets: Using the Morgan Stanley Capital International (MSCI) geographic definition, this region includes: United Kingdom, Europe (Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Netherlands, Norway, Spain, Sweden and Switzerland), Japan, Pacific Asia (Australia, Hong Kong, New Zealand, and Singapore) and the Western Hemisphere (Canada and other Americas).

Debt to Total Capital Ratio: This figure is the percentage of each company's invested capital that consists of debt. Companies with a high Debt to Total Capital level may be considered more risky. From a portfolio perspective, the portfolio Debt to Total Capital Ratio is a weighted average of the individual holdings' Debt to Total Capital Ratio.

Emerging Markets: Using MSCI's geographic definition, this region includes: Emerging Markets Asia (China, India, Indonesia, Malaysia, S Korea, Taiwan, and Thailand), Emerging Markets Europe, Mid-East and Africa (Czech Republic, Hungary, Poland, Russia, Turkey, Egypt, Morocco, and S Africa), and Latin America (Argentina, Brazil, Chile, Columbia, Mexico, Peru and Venezuela).

EPS (Earnings Per Share) Growth Rate (Projected): This measure represents the weighted average of forecasted growth in earnings expected to be experienced by the stocks within the portfolio over the next 3-5 years. From a portfolio perspective, the portfolio P/E ratio and EPS Growth Rate are weighted averages of the individual holdings' P/E ratios and EPS Growth Rates. Data calculated in FactSet.

EV/EBITDA: (Enterprise Value / Earnings Before Interest, Taxes and Depreciation-Amortization): The EV/EBITDA ratio is useful for global comparisons because it ignores the distorting effects of individual countries' taxation policies. It's used to find attractive takeover candidates. Enterprise value is a better measure than market cap for takeovers because it takes into account the debt which the acquirer will have to assume. Therefore, a company with a low EV/EBITDA ratio can be viewed as a good takeover candidate.

EV/IC: (Enterprise Value / Invested Capital) Ratio: Enterprise Value (EV), which is market capitalization minus cash plus debt divided by Invested Capital (IC), which is the sum of common stock, preferred stock and long-term debt. This number will get you a simple multiple. If it is below 1.0, then it means that the company is selling below book value and theoretically below its liquidation value.

Information Coefficient: A measure of the correlation between expected and actual returns.

Information Ratio: A measure of risk-adjusted return. The annualized excess return of the portfolio relative to a respective benchmark, divided by the annualized tracking error relative to that same benchmark. The higher the measure, the higher the risk-adjusted return.

Glossary - Terms

PBV: (Price/Book Value) Ratio: The PBV Ratio measures the value of a company's common stock relative to its shareholder's equity. A price-to-book multiple above one means that the price of the company's common stock is higher than its common shareholder's equity. A price-to-book multiple below one means that the price of the company's common stock are less than its break-up value, and the shares may be undervalued.

PCF: (Price/CashFlow): Some analysts favor the price/cash flow over the price-earnings (PE) ratio as a measure of a company's value. Cash flow is a measure of a company's financial health. It equals cash receipts minus cash payments over a given period of time.

P/E: (Price/Earnings) Ratio: This is the most common measure of how expensive a stock is. Simply, it is the cost an investor in a given stock must pay per dollar of current annual earnings. A high P/E generally indicates that the market is paying more to obtain the stock because it has confidence in the company's ability to increase its earnings. Conversely, a low P/E often indicates that the market has less confidence that the company's earnings will increase rapidly or steadily, and therefore will not pay as much for its stock.

R-squared: A measurement of how closely the portfolio's performance correlates with the performance of its benchmark, such as the MSC AC World Free ex US Index. In other words, it is a measurement of what portion of a portfolio's performance can be explained by the performance of the overall market or index. Ranges from 0 to 1, where 0 indicates no correlation and 1 indicates perfect correlation.

Risk (Standard Deviation): A measure of the portfolio's risk. A higher standard deviation represents a greater dispersion of returns, and thus a greater amount of risk. The annualized standard deviation is calculated using monthly returns.

Sharpe-Ratio: A risk-adjusted measure calculated using standard deviation and excess return (Portfolio return – Risk Free Rate) to determine reward per unit of risk. The higher the Sharpe ratio, the better the portfolio's historic risk-adjusted performance.

Tracking Error: Tracking Error measures the extent to which a portfolio tracks its benchmark. The tracking error of an index portfolio should be lower than that of an active portfolio. The tracking error will always be greater than zero if the portfolio is anything other than a replication of the benchmark.

Trailing 1-Year Turnover: This figure reflects the portfolio's trading activity by calculating the amount of the portfolio's holdings bought or sold over the prior year, expressed as a percentage of the portfolio's average market value. Turnover figures may be related to the amount of trading costs experienced by the portfolio.

Weighted Average Market Capitalization: Market capitalization refers to the total market value of each company's outstanding shares. The Weighted Average Market Capitalization for a portfolio is calculated as the average market capitalization of the stocks within the portfolio, weighted by the amount of each stock owned.

Weighted Median Market Capitalization: This calculation represents the median market capitalization of the stocks in the portfolio, weighted by the amount of each stock owned.
